

ABSTRACT OF THE DISCLOSURE

When a subject is imaged for the purpose of deciding the angle of view, the full image that is capable of being sensed by a CCD is displayed on an LCD.

- 5 The user designates the position of a cropping area in the image being displayed. Only image data representing the image within the border of the designated area is recorded on a memory card. Since the amount of image data to be recorded on the memory card is thus reduced,
- 10 image data representing images of a greater number of frames can be recorded on the memory card.
